Effectiveness of Applying the Transtheoretical Model to Improve Physical Activity Behavior of University Students

Covering the process of change, this book shows that there are three dimensions: temporal aspects of the process, the principles of change in mechanisms, and levels of change indicating problems addressed. This is applied to problems such as psychic distress, marital problems and addictions.

Application of the Transtheoretical Model to Cardiopulmonary Rehabilitation

Encyclopedia of Behavioral Medicine

This text examines trends in physical activity, aerobic fitness in teenagers and older adults, the role of physical activity in weight loss, new technology, marketing techniques and perspectives on behaviour intervention strategies in exercise programming and views on habitual exercise.

Transtheoretical Model and Sports Mouthguard Use: Application of Transtheoretical Model to Japanese Athletes Not Required to Use a Mouthguard

Social problems in many domains, including health, education, social relationships, and the workplace, have their origins in human behavior. The documented links between behavior and social problems have compelled governments and organizations to prioritize and mobilize efforts to develop effective, evidence-based means to promote adaptive behavior change. In recognition of this impetus, The Handbook of Behavior Change provides comprehensive coverage of contemporary theory, research, and practice on behavior change. It summarizes current evidence-based approaches to behavior change in chapters authored by leading theorists, researchers, and practitioners from multiple disciplines, including psychology, sociology, behavioral science, economics, philosophy, and implementation science. It is the go-to resource for researchers, students, practitioners, and policy makers looking for current knowledge on behavior change and guidance on how to develop effective interventions to change behavior.

Applying the Transtheoretical Model to Problematic Digital Game Use

Mastering Change The most significant factor in preventing sports-related injuries is wearing basic protective devices such as a mouthguard (MG), a soft plastic or laminate device used in sports to prevent oral injuries to the teeth, mouth, cheeks, tongue, and jaw. However, only a small number of young Japanese athletes use MG, simply because there is no mandate to do so in their particular sport. The Transtheoretical Model (TTM) is a successful framework for guiding behavioral change programs but it has not yet been applied to the issue of increasing MG use by young Japanese athletes. The purpose of this study is to examine whether the TTM can be applied to understanding the change in MG use behavior among young Japanese athletes who were in the pre-contemplation stage of using MG. A post hoc test found that the mean score of decisional balance for MG use and MG use self-efficacy were significantly lower among young Japanese athletes who were in the pre-contemplation stage than those who were in the other stages. The widespread prevalence of the pre-contemplation stage of MG use behavior among young Japanese athletes indicates the necessity of intervention programs to promote MG use self-efficacy and the perceived benefits of MG use behavior. The results indicate that the TTM was useful for determining the stages of MG use behavior among young Japanese athletes not required to use a MG.
Applying Transtheoretical Model Stages of Change to the Problem of Teacher Readiness for Using the Computer as an Instructional Tool

Health psychology is a rapidly expanding discipline at the interface of psychology and clinical medicine. This new edition is fully reworked and revised, offering an entirely up-to-date, comprehensive, accessible one-stop resource for clinical psychologists, mental health professionals and specialists in health-related matters. There are two new editors: Susan Ayers from Vanderbilt University Medical Center. The prestigious editorial team and their international, interdisciplinary cast of authors have recontextualised their much-acclaimed handbook. The book is now in two parts: part 1 covers psychological aspects of health and illness, and part 2 covers health-care processes. Part 2 covering the application of the Transtheoretical Model to health behavior change. Part 2 including chapters on the Transtheoretical Model of Behavior Change to Promote Greater Fruit and Vegetable Consumption. Part 2 including chapters on the Transtheoretical Model of Behavior Change to Promote Greater Fruit and Vegetable Consumption. Part 2 including chapters on the Transtheoretical Model of Behavior Change to Promote Greater Fruit and Vegetable Consumption.

Application of the Transtheoretical Model to Internet Self-disclosure

The Transtheoretical Approach About a decade ago, psychologists began exploring the commonalities among alcohol and drug abuse, smoking, and obesity. The term sub stance abuse evolved into the current concept of addictive behaviors, which recognizes similarities with other behaviors that do not involve consummatory responses (e. g., pathological gambling, compulsions, sexual deviations). Professional societies and journals now have been founded in both Britain and the United States with the purpose of focusing on research and treatment in the area of addictive behaviors. As the field has evolved, new models have emerged to address the questions and puzzles that face professionals. This volume examines some of these current issues and, in particular, explores common pro cesses of change that seem to cut across the addictive behaviors. The chapters are based on papers presented at the Third International Con ference on Treatment of Addictive Behaviors, which was held at North Berwick, Scotland, in August of 1984. The conference was organized around an integrative model of stages and processes of change that has been useful in organizing new knowledge about how to intervene with addictive behaviors. This model is set forth by its authors, Jim Prochaska and Carlo DiClemente, in Chapter 1. In Chapter 2, Fred Kanfer ex pounds his own model of self-regulation, which overlaps nicely with the Prochaska-DiClemente framework and provides a behavioral-theoretical context.

An Application of the Transtheoretical Model to Physical Activity Exercise in later life is important for health and well-being, yet motivating older adults to exercise can be difficult. This book addresses that need by tailoring "The Transtheoretical Model" of behavior change to the client's level of readiness for change. The contributors show how TTM can be used to help older adults with varying needs and abilities to change their exercise behaviors. This book is essential for health care professionals including nurses, exercise specialists, occupational therapists, social workers, and others interested in helping older adults incorporate exercise into their daily lives.

The Handbook of Behavior Change Changing unhealthy behaviors is easier said than done. Through interactive exercises, backed by countless research studies, Changing to Thrive will help readers progress through the Stages of Change and find the will power to create lasting change that will allow them to thrive. Eat healthy. Exercise. Quit smoking. Cut down on drinking. Reduce stress. Changing unhealthy behaviors is easier said than done. If you're like most of us, you have already made repeated attempts to change your lifestyle and improve your well-being without lasting success. You may attribute those failures to things like lack of motivation or the "wrong genes." But it's more likely that you simply don't know how to change. In this groundbreaking book, James O. Prochaska, PhD, and Janice M. Prochaska, PhD, guide you through a six-stage process designed to help you assess your readiness to change, then tap the inner resources necessary to thrive physically, emotionally, and socially. Backed by countless research studies, the stages of change model, developed by James Prochaska in collaboration with Carlo DiClemente, PhD, has revolutionized the field of behavior change. Through interactive exercises, Changing to Thrive will help you progress through the stages of change and learn that you have the power within to thrive.

Promoting Exercise and Behavior Change in Older Adults

Applying the Transtheoretical Model of Intentional Behavior Change to the Initiation of Binge Drinking in a College Sample This study was divided into three stages. The first phase of the study aimed to examine factors influencing the students' participation in physical activity. Eight female and male university students participated in the focus group. It was found that the participants' perceived benefits of physical activity were physical, psychological and social. Their perceived barriers to physical activity included both internal and external factors. Peer groups and family were found to be influential factors in the participants' decision to engage in physical activity. The second phase was designed to investigate 1,464 Thai university students' stages of change based on the Transtheoretical model (TTM) in relation to physical activity behavior. Regarding the stages of change, 19.6% of the participants were in the Precontemplation stage, 21.8% in the Contemplation stage, 44.2% in the Preparation stage, 8.9% in the Action stage, and 5.5% in the Maintenance stage. The majority of participants' BMI statuses were normal. There were significant differences in response according to gender and BMI status, gender and stages of change, and BMI status and stages of change. The third study used a pre-post randomized control group design to determine the effectiveness of the TTM-based intervention in improving physical activity behavior among university students. 210 freshman students, who classified in Precontemplation, Contemplation and Preparation stages, were randomly assigned to either experiment or control groups in each stage. The students in the experimental group received an eight-week stage-matched intervention, while the students in the control group participated in physical education activity classes. At the follow-up stage, the students in the experiment group significantly improved their scores compared to the baseline in all of the study variables (Stages of Change, Self-Efficacy, Pros, Cons, and Experiential and Behavioral Processes of Change). It was also found that students in the experimental group had higher improvement in Stages of Change, Self-Efficacy, Pros, Experiential and Behavioral Processes of Change, and perceived fewer Cons to physical activity. There were significant differences found in Processes of Change and Physical Activity Levels across Stages of Change, but not in other variables. The results of this study indicated that stage-matched intervention can be an effective means of increasing participation in physical activity among university students.
